

New England Airsoft Events

Control Point Score Module v0.1

Unit External View

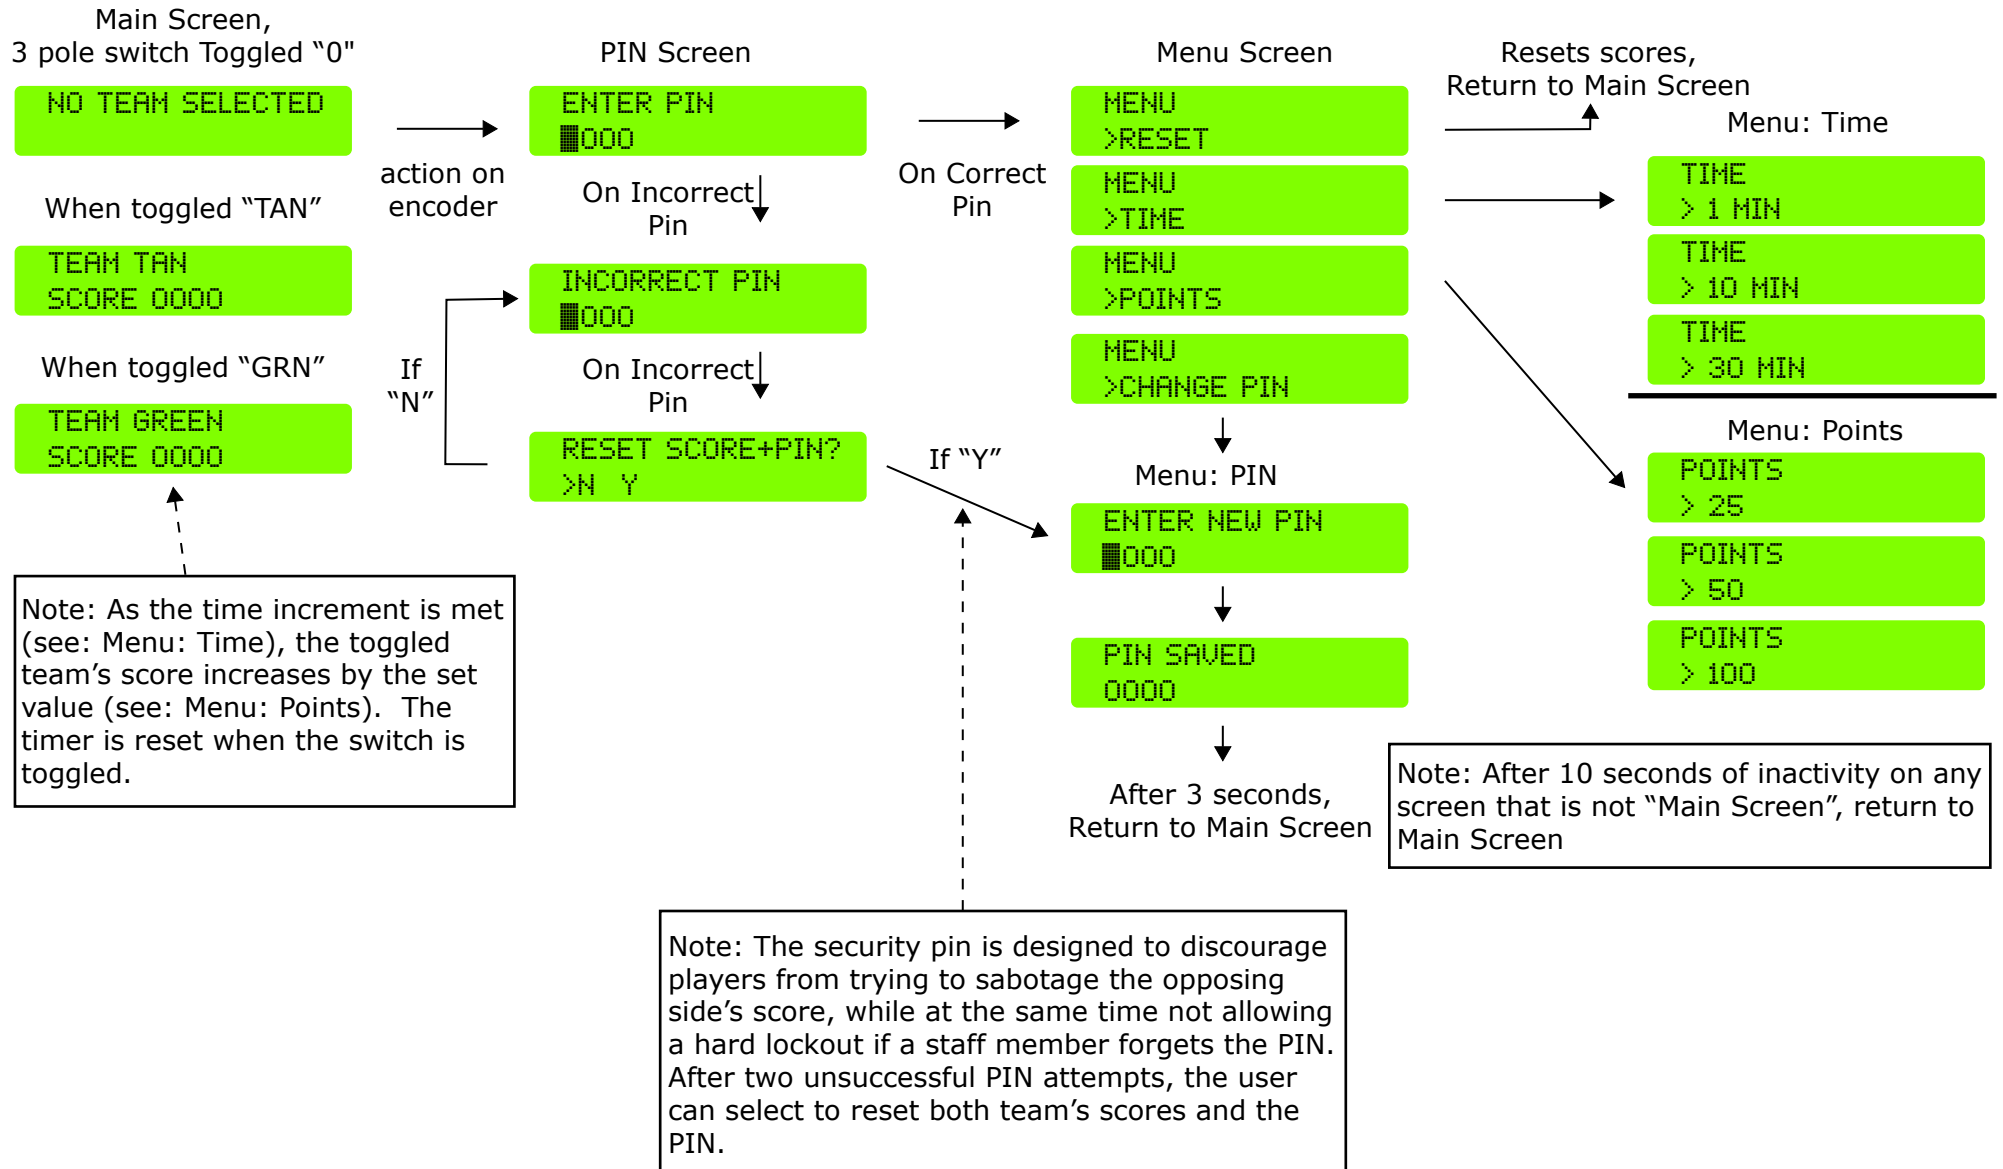

The device counts up a score for the team that is selected with the 3 pole toggle switch. When the switch is set in the center position ("0"), the screen shows "No Team Selected", and no score is accumulated. The scoring works by the following: once the switch is toggled to a side, a timer starts for that side. Once the timer expires, a score is tallied, and the timer resets. Using the menu, the user can determine the length of the timer and the amount of points that will be scored when the timer expires (e.g. 25 points every 10 minutes). If the switch is toggled from a side, the timer resets. This is so the point must be held for a certain time before any points can be scored. When a side is toggled, the corresponding LED is lit. At the end of the game, staff can check the score by toggling each respective side. For security, no settings can be changed without a 4-digit PIN. When the rotary encoder is used from the main screen, a dialogue asking for the PIN is displayed. After entering the correct PIN, the user can reset the scores, change the scoring parameters, and change the PIN. Alternatively, after entering the PIN incorrectly twice, the user is asked if they want to reset the PIN and the scores as to prevent a hard lockout.
